

AUSTRALIAN PITUITARY FOUNDATION LTD *in association with*
FREMANTLE HOSPITAL, WA *presents:*

Pituitary Conditions & Treatments

Located at the base of the brain, the pituitary is commonly referred to as the master gland because of the role it plays in controlling the function of all aspects of the body's vital endocrine system.

These glands produce complex hormone secretions which define the differences between male and female, regulate growth in childhood, control stress response, metabolism, body composition, vitality, emotions, sexual maturity and reproduction.

Any disturbance or failure of pituitary function can be potentially devastating.

You are invited to a public education seminar, which addresses various aspects of managing and living with a pituitary condition.

To submit your registration

Please return your completed registration form by Friday 29 October 2010 to:

Australian Pituitary Foundation Ltd
 PO Box 570
 Mt Ommaney QLD 4074

The APF's mission is to provide support to those who have experienced pituitary gland conditions. We promote awareness and disseminate information helpful to the medical community, public, pituitary patients and their families.

The pituitary gland is perhaps one of the most important but least known glands in the human body. Most people have not even heard of it, yet it has an enormous control over our body's ability to function normally.

We make up a very small and quite rare group of patients and find people appreciate the opportunity to make links with other patients and families, considering the common feeling of isolation experienced by most people associated with rare conditions.
